What is battery testing?

Battery testing is a set of controlled tests that evaluate a battery's performance, capacity, safety, and life expectancy. It informs manufacturers, researchers, and users about battery behavior under a wide range of environmental, electrical, and mechanical conditions. What are the Different Types of Battery Testing?

What types of battery testing systems are available?

Fuel cell and flow battery test systems also available. Turn-key testing platforms including: regenerative battery cyclers, dynamic automation, high common mode cell voltage monitoring, and Emerald(TM) control software with advanced scripting language. Greenlight also offers automated battery assembly equipment and lithium cell conditioning cabinets.

What is a battery test chamber?

Battery test chambers are generic tools for testing battery performance in harsh environments. Properly used, they render battery-powered products safe, long-lasting, and reliable by simulating actual conditions of stress, including temperature, humidity, and vibration.

How does a battery test work?

The battery is subject to testing under severe conditions like high/low temperature, humidity, or vibration. This allows one to ascertain how the battery is going to behave in real environments, particularly in tough or demanding uses. This entails mimicking hazardous conditions such as short circuit, overcharge, puncture, or burning.
