# Can the solar energy storage inverter be connected to the grid

How do inverters provide grid services?

In order to provide grid services, inverters need to have sources of power that they can control. This could be either generation, such as a solar panel that is currently producing electricity, or storage, like a battery system that can be used to provide power that was previously stored.

What is a grid-tied inverter?

A grid-tied inverter solely designed for solar-to-grid applications, with no battery support. It provides efficient solar energy conversion and direct grid feed-in but cannot store energy. Ideal for locations with stable grid access and net metering policies, where users aim to offset electricity bills without investing in battery systems.

What is solar inverter based generation?

As more solar systems are added to the grid, more inverters are being connected to the grid than ever before. Inverter-based generation can produce energy at any frequency and does not have the same inertial properties as steam-based generation, because there is no turbine involved.

What is a hybrid solar inverter?

Hybrid inverters combine the key features of both on-grid and off-grid systems, offering flexibility, energy independence, and enhanced control over solar energy usage. These inverters convert DC power from solar panels into AC for immediate use, while also storing surplus energy in batteries for later consumption.
