
Factory price d curve breaker in Los-Angeles

What is a D-trip circuit breaker?

Breakthrough current is the maximum current that the circuit breaker can safely stop in the event of a short circuit. D-trip circuit breakers prevent nuisance tripping,so they are best for equipment that has a high spike in current at startup,such as transformers,power supplies,and heaters.

What is a supplemental circuit breaker?

Also known as supplemental protectors,these circuit breakers mount directly to DIN rail downstream from a branch circuit breaker to protect a single piece of equipment. They are rated UL1077 for protection against overloads and short circuits. Because they are thermal-magnetic,these breakers trip two ways.

What causes a circuit breaker to trip?

They either trip when heat is generated slowly by consistent low-level overload current, or they trip quickly when the magnetic coil senses a high-current short circuit. Breakthrough current is the maximum current that the circuit breaker can safely stop in the event of a short circuit.
