
Mozambique environmentally friendly lithium iron phosphate battery station cabinet

Why are lithium iron phosphate batteries used in electric vehicles?

Among many power batteries, lithium iron phosphate (LFP) batteries are widely used to power electric vehicles because of their distinctive characteristics, including safety, relatively long cycle life, environmental friendliness, high energy density, high power density and few maintenance requirements (Scrosati and Garche, 2010; Xu et al., 2012).

What is the environmental impact of lithium iron phosphate batteries?

For lithium iron phosphate batteries, in addition to the production phase, the environmental impact of the use phase is also considerably significant. As the environmental impact of this phase is only sourced from electric energy consumption, the usage of electric energy and the cleanliness of energy sources are critical to the assessment results.

What is the percentage contribution of lithium iron phosphate batteries to indices?

In general, the percentage contribution of the use phase of lithium iron phosphate batteries to the indices is lower than that of the production phase, except for the primary energy consumption and GWP.

What is the production phase of lithium iron phosphate batteries?

3.1. Production phase The production phase of lithium iron phosphate batteries mainly includes the production of battery materials, the production of cells, and the production of battery systems.
