# Nigeria Lagos solar Bifacial Module Company

What is a bifacial solar panel?

They can be thus said to be "monofacial". As is directly implied in the name, a bifacial solar panel is a solar module that is constructed in such a way to expose both the front and backside of the solar cells to sunlight so as to produce electricity from both sides of the panel.

Are bifacial solar modules a disruptive trend?

Bifacial modules have been around since the 1960's, however it was with the recent development of the Passivated Emitter Rear Cell technology that has significantly increased their efficiencies and expanded their potentials, that they recently became the disruptive trend in the solar module market.

Are solar panels "monofacial"?

Traditional solar panel modules have a transparent top side that has an arrangement of solar cells that produce the electricity and a bottom side that is mostly made of an opaque polymer backsheet to which a junction box is attached. They can be thus said to be "monofacial".

Can bifacial panels be installed directly on rooftops?

Bifacial panels will not fulfil their production potential if they are installed directly on rooftops because the rear side would be blocked from receiving any incident light that would be reflected back to the rear side of the bifacial panel. They are thus least useful for rooftop installations.

Date: Sept 2025 Project Type: Solar Panel Project Project Site: Lagos, Nigeria Quantity and specific configuration: 40ft 550W Bifacial Mono Solar Panel Description: In 2024, Nigeria ...
