
Self-discharge of zinc-manganese flow battery

Do aqueous zinc batteries self-discharge during idle periods?

The self-discharge of aqueous zinc batteries during idle periods remains elusive, and warranting adequate voltage and sufficient capacity is not trivial, due to the components of the battery system and the reciprocal influence among them. To investigate the origin of self-discharge, herein we construct a Zn|

Are zinc-manganese dioxide batteries cathode-free?

Authors to whom correspondence should be addressed. Zinc-manganese dioxide (Zn-MnO₂) batteries, pivotal in primary energy storage, face challenges in rechargeability due to cathode dissolution and anode corrosion. This review summarizes cathode-free designs using pH-optimized electrolytes and modified electrodes/current collectors.

What is a zinc-based flow battery?

The history of zinc-based flow batteries is longer than that of the vanadium flow battery but has only a handful of demonstration systems. The currently available demo and application for zinc-based flow batteries are zinc-bromine flow batteries, alkaline zinc-iron flow batteries, and alkaline zinc-nickel flow batteries.

Are aqueous zinc batteries self-dischargeable?

Aqueous zinc batteries (AZBs) are a promising power storage technology for electricity storage in applications requiring high safety and power density. However, because of the use of aqueous electrolytes, AZBs face problems of self-discharge caused by a number of material and system design requirements.

Unlike the alkaline electrolytes, a neutral flow system can effectively avoid the zinc dendrite issues. As a result, a Zn-Mn flow battery demonstrated a CE of 99% and an EE of ...

We introduce a novel approach to Zinc-MnO₂ battery architecture utilizing a 3D network of carbon nanofibers as both current collector and electrode material, promising ...

The self-discharge problem is especially bad for aqueous zinc batteries (AZBs), which are a type of rechargeable batteries that hold certain advantages over Li-ion batteries, ...

This review focuses on the self-discharge process inherent in various rechargeable electrochemical energy storage devices including rechargeable batteries, supercapacitors, and ...

Abstract Zinc-air self-charging batteries integrate energy harvesting, storage, and conversion by utilizing ambient oxygen to drive spontaneous redox reactions, but their ...

Li et al. discuss the mechanisms and mitigation strategies of the self-discharge phenomenon for aqueous zinc-ion batteries. The authors discuss how self-discharge is ...
